

# Coriolis Mass Flowmeter

Coriolis flow meter is a direct and precise measurement of fluid mass flow meter to the main structure of the novel, U-shaped two side-by-side tubes, so that the curved parts of the two tubes slightly vibrate, and then the straight vibration situated on both sides.

When the Coriolis mass flowmeter is working normally, the vibration of the measuring tube causes the Coriolis force of the measuring medium in the tube. The greater the Coriolis force, the greater the friction between the flowing medium and the measuring tube wall, and the greater the pressure loss of the flowmeter. The Coriolis force is proportional to the flow rate of the measurement medium. Therefore, when selecting the Coriolis mass flowmeter, the influence of the measured medium flow rate should be considered. The influence of the medium flow rate on the selection of the Coriolis mass flowmeter is related to the measurement principle of the Coriolis mass flowmeter.

Batch Control

Blending/ Filling/ Dosing

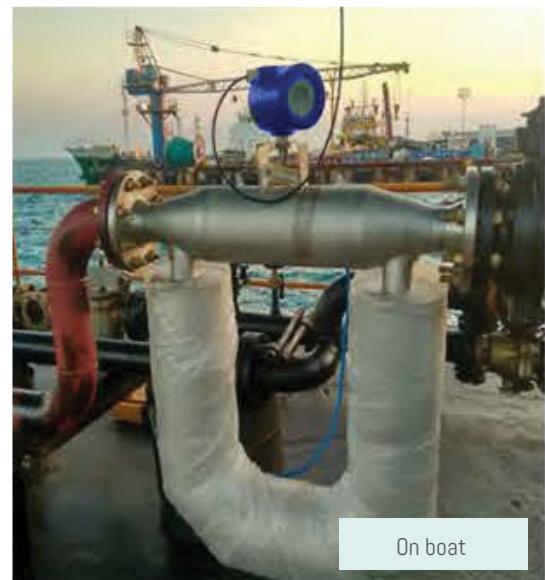

Custody Transfer

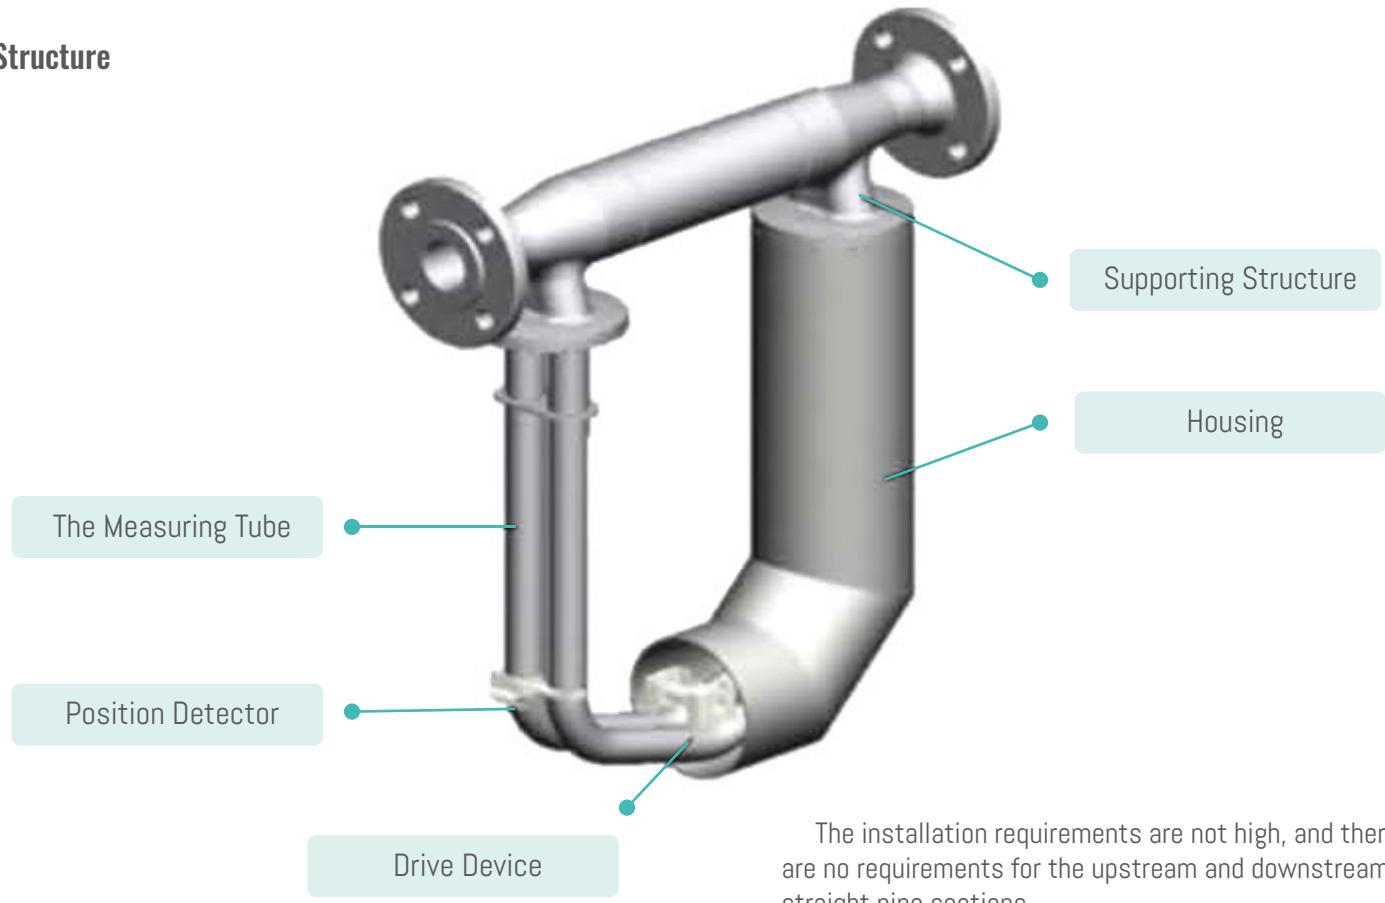

Obviously, the Coriolis mass flowmeter is mainly used to measure the mass flow rate of the medium or output the calculated volume flow rate. The selection parameters provided by the process professional only involve the medium mass flow rate or volume flow rate; therefore, the influence of the medium flow rate will be ignored. The measuring tube of Coriolis mass flowmeter has small amplitude, which can be regarded as no moving parts and no obstructing parts, and its measured value is not affected by the flow field in the pipeline.

## Feature

- High flow accuracy : 0.1% Optional and 0.2% Standard
- Wide medium temperature range - 200 °C to 300 °C  
(For medium such as liquid nitrogen, oxygen and argon)
- High pressure handling up to 35 MPa in oil, Drilling well and etc
- Multiple parameters measured : Mass Flow, Volume Flow, Density and Temperature

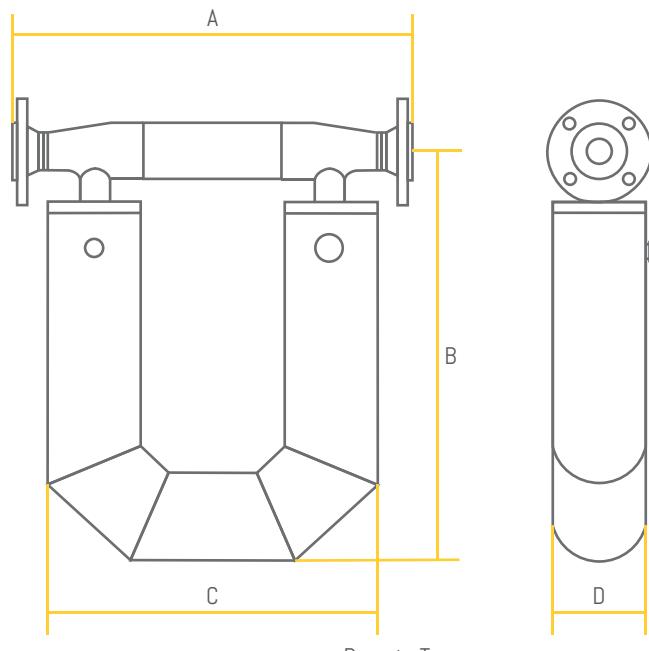

## Structure

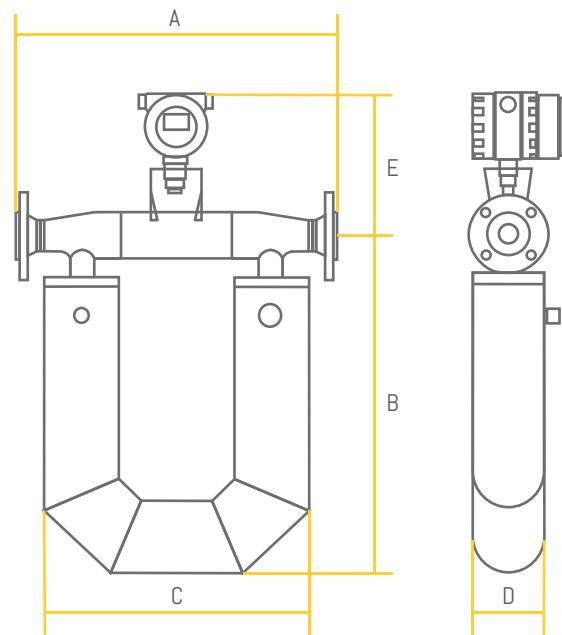

The installation requirements are not high, and there are no requirements for the upstream and downstream straight pipe sections.

## Installation Method

The meter should be installed downward when measuring liquid flow, so that air can not get trapped inside the tubes.

The meter should be installed upward when measuring gas flow, so that liquid can not get trapped inside the tubes.

The meter should be installed sideward when the medium is turbid liquid to avoid particulate matter accumulated in the measuring tube. The flow direction of medium goes from the bottom up through the sensor.

Technical Performance Parameters	
Flow Accuracy	± 0.2% Optional ± 0.1%
Diameter	DN3 - DN200 mm
Flow Repeatability	± 0.1 - 0.2%
Density Measuring Range	0.3 - 3.000 g/cm3
Density Accuracy	± 0.002 g/cm3
Temperature Measuring Range	- 200 to 300 °C (Standard Model - 50 to 200 °C)
Temperature Accuracy	± 1 °C
Output of Current Loop	4-20 mA, Optional Signal of Flow Rate/ Density/ Temperature
Output of Frequency/ Pulse	0 - 10000 Hz Flow Signal (Open Collector)
Communication	RS485, MODBUS Protocol
Power Supply of Transmitter	18-36 VDC Power ≤ 7W or 85 - 265 VAC Power 10W
Protection Class	IP67
Material	Measuring Tube SS316L, Housing SS304
Pressure Rating	4.0 MPa (Standard Pressure)
Explosion - Proof	Exd (ia) IIC T6Gb
Enviroment Parameters	
Ambient Temperature	-20 to 60 °C
Enviroment Humidity	≤95% RH
